# Chapter 1

# Introduction

## 1.1 Abstract:

This Online Examination System is a software solution, which allows any industry or institute to arrange, conduct and manage examinations via an online environment. It can be done through the Internet/Intranet and/ Local Area Network environments. Some of the problems faced during manual examination systems are the delays occurred in result processing, filing poses a chance of loss of records is high also record searching is difficult. Maintenance of the system is also very difficult and takes lot of time and effort. Online examination is one of the crucial parts for online education system. It is efficient, fast enough and reduces the large amount of material resource. An examination system is developed based on the web. This paper describes the principle of the system, presents the main functions of the system, analyzes the auto-generating test paper algorithm, and discusses the security of the system.

## 1.2. Scope of system:

Online Examination arrangement is a Multiple-Choice Questions based Examination framework. It gives a simple way to utilize the environment for both test-conductors and understudies showing up for examination. Online Examination System is a web application that sets up a system between the establishments and understudies. Establishments enter on the site the inquiries they need in the exam. These inquiries are shown as a test to the qualified understudies. The answers enter by the understudies are then assessed what's more, their score is computed and spared. This score then can be got to by the organizations to focus the passes understudies or to assess their execution. Online Examination System gives the stage yet does not specifically take an interest in, nor is it included in any tests led. Inquiries are posted not by the site, but rather clients of the site. The site requires an organization to enlist before posting the inquiries. The site has a manager who watches out for the general working of the framework.

## 1.3. Operating Environment

- Hardware Requirement:
  - Client Side
    - Desktop/Laptop
    - Mobile
    - Tablet
    - Internet connection
    - Ram: 4GB and more
  - Server Side
    - Web Server
    - Ram: 4GB and more
- Software Requirement:
  - Client Side
    - Operating System: Windows, Android, IOS, Linux

## 1.4. Brief Description of Technology Used Operating System used:

**HTML:**

HTML or Hyper Text Mark-up Language is the standard mark-up language used to create web pages.HTML is written in the form of HTML elements consisting of tags enclosed in angle brackets (like<html>). HTML tags most commonly come in pairs like <h1>and </h1>, although some tags represent empty elements and so are unpaired, for example <img>.

The first tag in a pair is the start tag, and the second tag is the end tag (they are also called opening tags and closing tags).

The purpose of a web browser is to read HTML documents and compose them into visible or audible web pages. The browser does not display the HTML tags, but uses the tags to interpret the content of the page. HTML describes the structure of a website semantically along with cues for presentation, making it a mark-up language rather than a programming language.

**CSS:**

Cascading Style Sheets (CSS) is a stylesheet language used to describe the presentation of a document written in HTML or XML (including XML dialects such as SVG, MathML or XHTML). CSS describes how elements should be rendered on screen, on paper, in speech, or on other media.

CSS is among the core languages of the open web and is standardized across Web browsers according to W3C specifications. Previously, development of various parts of CSS specification was done synchronously, which allowed versioning of the latest recommendations. You might have heard about CSS1, CSS2.1, and CSS3.

When tags like <font>, and color attributes were added to the HTML 3.2 specification, it started a nightmare for web developers. Development of large websites, where fonts and color information were added to every single page, became a long and expensive process.

CSS handles the look and feel part of a web page. Using CSS, you can control the color of the text, the style of fonts, the spacing between paragraphs, how columns are sized and laid out, what background images or colors are used, layout designs, variations in display for different devices and screen sizes as well as a variety of other effects.

CSS is easy to learn and understand but it provides powerful control over the presentation of an HTML document. Most commonly, CSS is combined with the markup languages HTML or XHTML.

Cascading Style Sheet (CSS) is used to set the style in web pages that contain HTML elements. It sets the background color, font-size, font-family, and color … etc. property of elements on a web page. There are three types of CSS, which are given below Inline CSS. Internal or Embedded CSS

Inline CSS:

Inline CSS contains the CSS property in the body section attached with element is known as inline CSS. This kind of style is specified within an HTML tag using the style attribute.

Internal or Embedded CSS:

This can be used when a single HTML document must be styled uniquely. The CSS rule set should be within the HTML file in the head section i.e the CSS is embedded within the HTML file.

External CSS:

Contains separate CSS file which contains only style property with the help of tag attributes (For example class, id, heading … etc.). CSS property written in a separate file with .css extension and should be linked to the HTML document using link tag. This means that for each element, style can be set only once and that will be applied across web pages.

**PHP:**

PHP (recursive acronym for PHP: Hypertext Preprocessor) is a widely-used open-source general purpose scripting language that is especially suited for web development and can be embedded into HTML. Instead of lots of commands to output HTML (as seen in C or Perl), PHP pages contain HTML with embedded code that does "something" (in this case, output "Hi, I'm a PHP script!"). The PHP code is enclosed in special start and end processing instructions that allow you to jump into and out of "PHP mode." What distinguishes PHP from something like client-side JavaScript is that the code is executed on the server, generating HTML which is then sent to the client. The client would receive the results of running that script, but would not know what the underlying code was. You can even configure your web server to process all your HTML files with PHP, and then there's really no way that users can tell what you have up your sleeve The best things in using PHP are that it is extremely simple for a newcomer, but offers many advanced features for a professional programmer. Don't be afraid reading the long list of PHP's features. You can jump in, in a short time, and start writing simple scripts in a few hours.

**MYSQL:**

MySQL, the most popular Open-Source SQL database management system, is developed, distributed, and supported by Oracle Corporation. The MySQL Web site (http://www.mysql.com/) provides the latest information about MySQL software.

A relational database stores data in separate tables rather than putting all the data in one big storeroom. The database structures are organized into physical files optimized for speed. The logical model, with objects such as databases, tables, views, rows, and columns, offers a flexible programming environment. You setup rules governing the relationships between different data fields, such as one to one, one-to-many, unique, required or optional, and "pointers" between different tables. The database enforces these rules, so that with a well-designed database, your application never sees inconsistent, duplicate, orphan, out-of-date, or missing data.

MySQL databases are relational

The SQL part of "MySQL" stands for "Structured Query Language". SQL is the most common standardized language used to access databases. Depending on your programming environment, you might enter SQL directly (for example, to generate reports), embed SQL statements into code written in another language, or use a language-specific API that hides the SQL syntax

SQL is defined by the ANSI/ISO SQL Standard The SQL standard has been evolving since 1986 and several versions exist. In this manual, "SQL-92" refers to the standard released in 1992, "SQL 1999" refers to the standard released in 1999, and SQL 2003 refers to the current version of the standard We use the phrase "the SQL standard to mean the current version of the SQL Standard at any time

• MySQL software is Open Source

Open-Source means that it is possible for anyone to use and modify the software Anybody can download the MySQL software from the Internet and use it without paying anything. If you wish, you may study the source code and change it to suit your needs. The MySQL software uses the GPL (GNU General Public License), http://www.fsf.org/licenses/. to define what you may and may not do with the software in different situations. If you feel uncomfortable with the GPL or need to embed MySQL code into a commercial application, you can buy a commercially licensed version from us. See the MySQL Licensing Overview for more information (http://www.mysql.com/company/legal/licensing/).code is enclosed in special start and end processing instructions that allow you to jump into and out of "PHP mode."

# Chapter 2

# Proposed System

This application is used to conduct online examination. The students can sit at individual terminals and login to write the exam in the given duration. 0… The questions have to be given to the students. This application will perform correction, display the result immediately and also store it in database. This application provides the administrator with a facility to add new exams. This application provides the Instructor add questions to the exam, modify questions in the exam in a particular exam. This application takes care of authentication of the administrator, Instructor as well as the student.

## 2.1. Study of Similar System:

Online Examination for Work provides the ability to monitor candidates focus on the Test screen while they are attempting Tests, and this is referred to as Proctoring. Through proctoring, recruiters can assess their candidate's authenticity and note any suspicious activities or malpractices during the Test. At the start of a Test, with the candidates' consent, the Proctoring feature automatically enables their webcam and records periodic snapshots of a candidate until the Test ends. Recruiters in online Examination who review candidates Test performance can also view the recorded snapshots of their activities during the Test and note any forbidden activities.

## 2.2. User of System:

- **Student**: Student Can register and login to the system, and student can take test, choose subject, and view the result.

- **Admin**: Admin conducts the exam. Admin can adds new question, changes the question, delete the question, modify the question. Admin can view the students, admin manages the users.

# Chapter3

# Analysis and Design

## 3.1. System Requirements (Functional and Non-Functional)

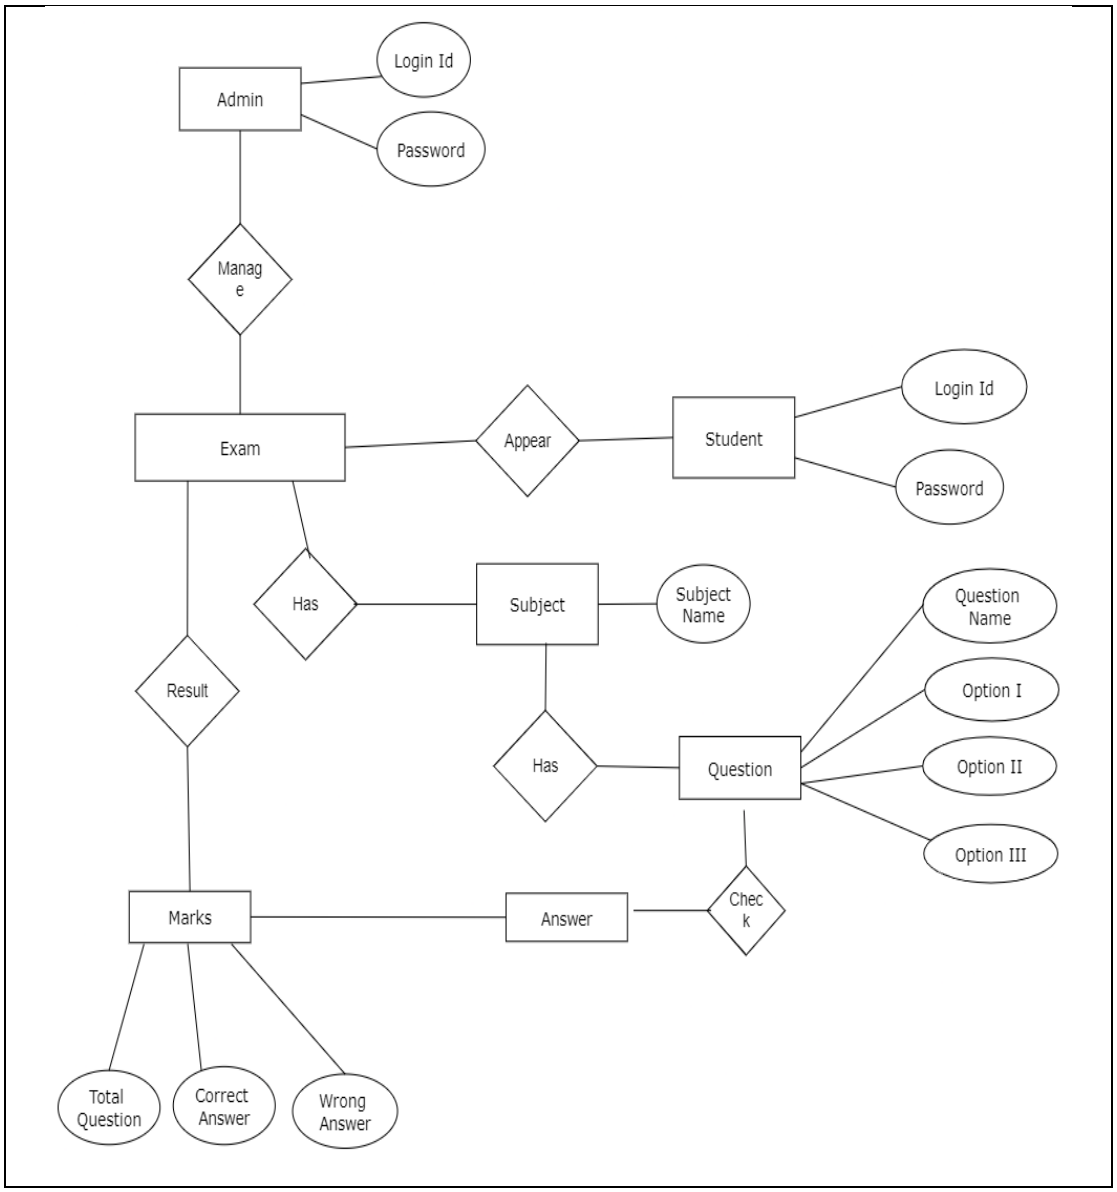
**Functional Requirements:**

Functional requirement are those requirements that define the functionality of project. In other functional requirements are basically how the system works for the users. Interface of software to provide the interaction between students, admins and teachers. Software provides the platform and saves the time. Also, software saves the record.

**Non-Functional Requirements:**

Functional requirement are those requirements that define the functionality of project. In other functional requirements are basically how the system works for the users. Interface of software to provide the interaction between students, admins and teachers. Software provides the platform and saves the time. Also, software saves the record.

## 3.2.Entity Relationship Diagram(ERD) :



## 3.3 Table Structure:

1) Student:

| Column Name | Data Type | Primary Key | Foreign Key |
|---|---|---|---|
| Login Id | varchar | yes | |
| Password | Varchar | | |
| Name | Varchar | | |
| Address | Varchar | | |
| City | Varchar | | |
| Phone | Number | | |
| E-mail | varchar | | |

2) Subject:

| Column Name | Data Type | Primary Key | Foreign Key |
|---|---|---|---|
| Subject Id | int | yes | |
| Subject Name | Varchar | | |

3) Questions:

| Column Name | Data Type | Primary Key | Foreign Key |
|---|---|---|---|
| Question id | Int | yes | |
| Question Description | Varchar | | |
| Option I | Varchar | | |
| Option II | Varchar | | |
| Option III | Varchar | | |
| Option IV | Varchar | | |

| | | | |
|---|---|---|---|
| Correct Answer | int | | |

4)Admin:

| Column Name | Data type | Primary key | Foreign Key |
|---|---|---|---|
| Id | Int | | |
| Login Id | Varchar | yes | |
| Password | Varchar | | |

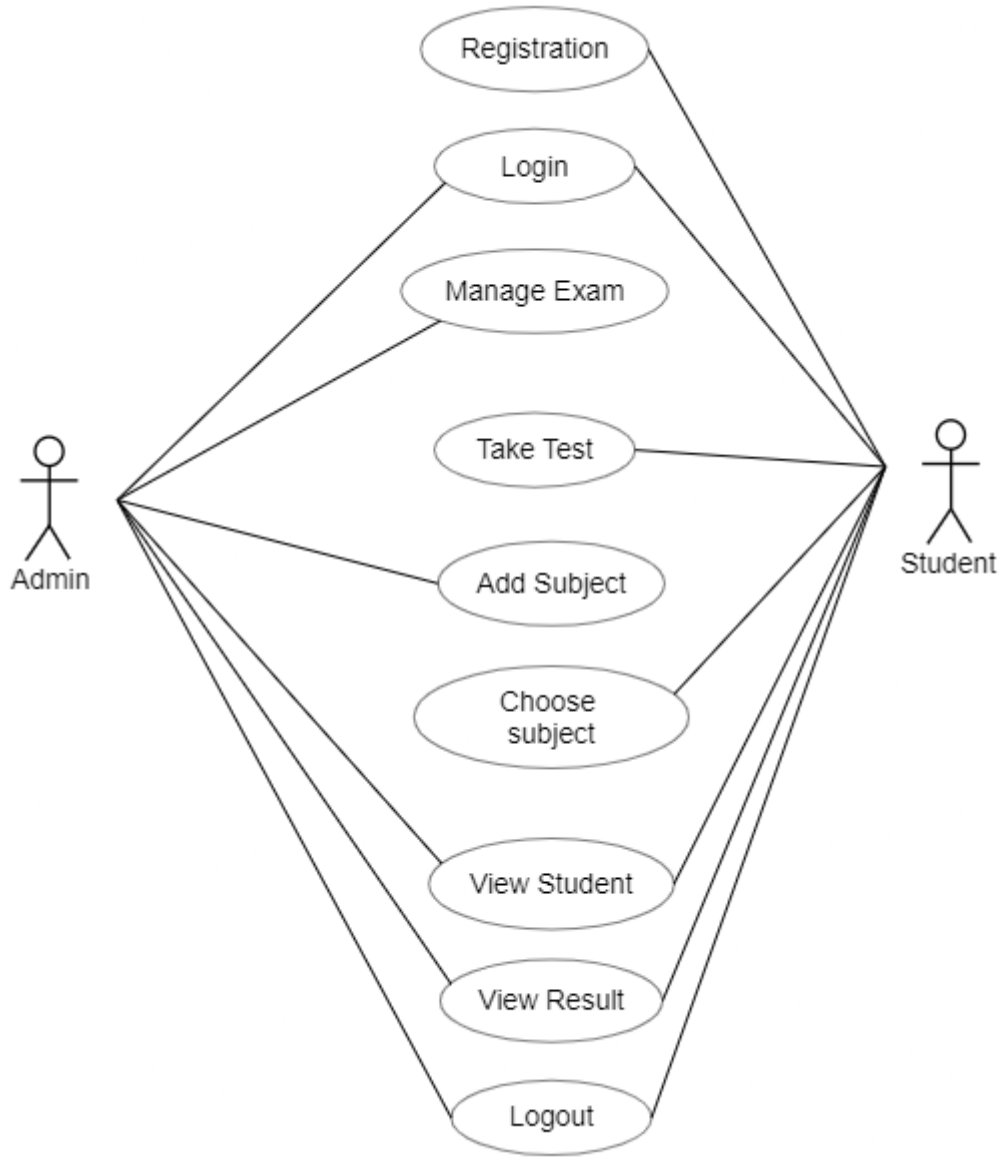
5) Test Table:

| Column Name | Data Type | Primary Key | Foreign Key |
|---|---|---|---|
| Test Id | Int | yes | |
| Test Name | varchar | | |
| Subject Id | Int | | yes |
| Total Question | varchar | | |

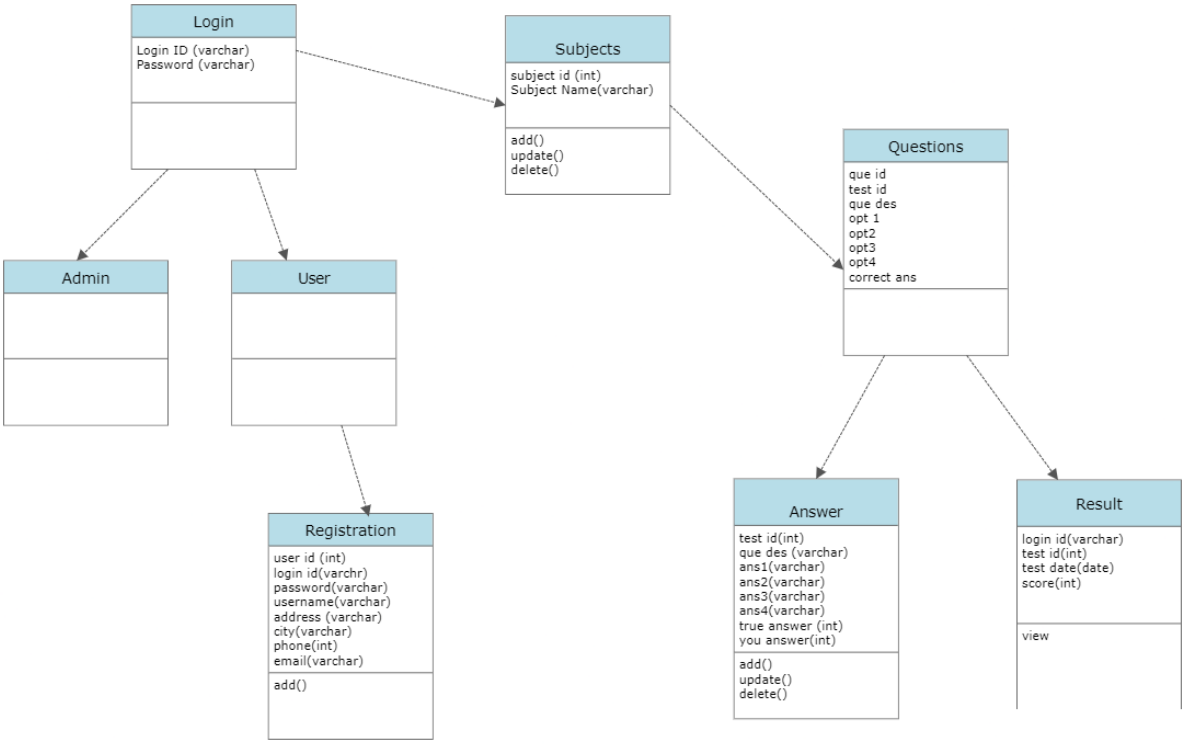
6) Results:

| Column Name | Data Type | Primary Key | Foreign Key |
|---|---|---|---|
| Login ID | Int | | yes |
| Test ID | Int | | yes |
| Score | Int | | |

## 3.4. Use Case Diagram:



## 3.5. Class Diagram:



## 3.6. Activity Diagram:

```

# Chapter 5

# Testing

## 5.1 Test Strategy

Test strategy describes the overall approach to testing. The goal of the testing process is to determine all faults in our project. The program was subjected to a set of test inputs and many explanations were made and based on these explanations it will be decided whether the program behaves as expected or not.

Strategies used are:

Functional Testing: This ensures that the functionalities of a web application are properly functioning or not.

Interface Testing: This testing method ensures that the three main components of a web application which are web server, web browser and database are running harmoniously. This testing type checks whether there is any interruption while the data is being transferred. Upon that, the communication taking place between various interfaces is also thoroughly checked.

Compatibility Testing: This testing methodology ensures that a particular web application is compatible with all browsers. Compatibility testing takes place at three levels which are browser compatibility, operating system compatibility and device compatibility.

## 5.2 Unit Test Plan:

Unit testing is commenced when a unit has been created and effectively reviewed. In order to test a single module, we need to provide a complete environment i.e. besides the section we would require.

I. The procedures belonging to other units that the unit under test calls.
II. Non local data structures that modules accesses.
III. A procedure to call the functions of the unit under test with appropriate parameters.

**Types of Unit Testing:**

**1) White Box Testing**

White box testing is a test case design method that uses the control structure of the procedural design to derive test cases. Test cases can be derived that

I. Guarantee that all independent paths within a module have been exercised at least once.
II. Exercise all logical decisions on their true and false sides,

III. Execute all loops at their boundaries and within their operational bounds, and Exercise internal data structures to ensure their validity.

**2) Black Box Testing**

Black box testing also called behavior testing, focuses on the functional requirement of the software. That is black box testing enables the software engineers to derive test of input condition. That will fully exercise all functional requirements for a program. Black box testing is not an alternative to a white box testing technique. Rather it is a complementary approach that is likely to in cover a different class of error's then white box method. Black Box Testing attempts to find errors in the following category.

I. Incorrect or Missing function
II. Interface errors
III. Errors in a data structure or external database accesses
IV. Behavior or performance error's and
V. Initialization and Termination error's

**3) Gray-Box Testing**

It's referred to as semi-transparent testing. It is a combination of a Black Box and White Box testing. It is the type of testing in which tester aware with internal functionality of a method or unit but not in a deeper level like white box testing. In this, the user partially aware of the internal functionality of a system. Different type of testing covered under a Gray box testing is mentioned as following

I. Matrix testing.
II. Pattern Testing.
III. Orthogonal Pattern testing.

IV. Regression Testing.

**Test case for login:**

| Sr. No. | Steps to be executed | Expected Result | Result |
|---|---|---|---|
| 1 | Enter a valid username(userid) E.g:Raj | System should allow username | Pass |
| 2 | Enter a valid password E.g. pass@123 | System should accept & match the password | Pass |
| 3 | Enter an invalid username(email) E.g. rajp | System should give error message. | Fail |

**Test case for Registration:**

| Sr. No. | Steps to be executed | Expected result | Result |
|---|---|---|---|
| 1 | Enter a valid username(email) E.g. raj | System should allow username | Pass |
| 2 | Enter a valid password E.g. pass@123 | System should accept password | Pass |

| | | | |
|---|---|---|---|
| 3 | Enter an invalid email<br>E.g. rajp | System should give error message | Fail |
| 4 | First Name<br>E.g. Raj | System should accept valid name | Pass |
| 5 | Last Name<br>E.g. Pawar | System should accept valid name | Pass |
| 6 | Phone<br>E.g. 8472787332 | System accepted 10 digit phone number | Fail |

# Chapter 6

# Limitation of proposed system

## Limitation of proposed system

**1. The time and place of online exam are flexible.** The most highlight of online examination lies in its convenience, quickness, efficiency and quickness. It is basically free from time and place constraint on the basis of ensuring the normal network, which greatly facilitates the examination.

**2. It saves time and cost.** There is no need to arrange an examination room and no need to print exam papers. Moreover, the online exam system can obtain ideal effect with lower cost.

**3. The advantages of the number of candidates.** The number of candidates can be arranged in the examination room is limited. The online exam system allows multiple people to take the exam online at the same time.

**4. With comprehensive functions.**

(1) All the processes can be done through the system. Such as basic question creation, question bank planning, automatic exam paper and data analysis and so on.

(2) Mark exam papers intelligently. In addition to reducing manpower and material resources, many possible errors are reduced and the accuracy rate is guaranteed.

(3) Generate visual data analysis, the scores and rankings of the candidates are clear at a glance. This is very helpful for later education tracking and planning.

(4) Please refer to the online exam system for more.

# Chapter7

# Proposed Enhancement

## Proposed Enhancements

The online education market in India is estimated to grow by 14.33 billion dollars by 2024.

Almost all the competitive examinations in India embraced the online CBT examination system. India has organized the world's largest recruitment drive through online examination.

- **Automated:** Online examination system is fully automatic. It is therefore quite accurate and valuable for both students and teachers. It also completely eliminates the necessity for traditional pen-paper based examinations.

- **Modern Infrastructure:** Universities and colleges need a modern online examination system to analyze and enhance student results. To be able to meet the needs of our clients, we have invested in the greatest infrastructure available.

- **Reliable & Secure:** Amazon web Services (AWS), the world's most dependable cloud provider, powers our application. These are the same services that power Facebook & Twitter.

  We also provide world-class disaster recovery security and scale-ability.

- **Flexible & Accessible:** The candidates/students can take the assessment or examination by logging into the online examination system during class or at home with the use of their own devices. Apart from this, They also get the opportunity to see their results and answers as instant feedback about their knowledge or understanding of their chosen topics.

- **Remote Proctoring:** We have come up with a variety of remote proctoring options. With remote proctoring, Online tests can be conducted without any fear of unfair practices and cheating.

- **Quick Result Processing:** The results of the online assessment are calculated practically instantaneously and given to the students, Through an online examination system. In paper-based assessments, however, evaluating the answer is a lengthy process and prone to human mistakes.

- **Cost-effective:** In the online examination, the examination cost is very minimal. All the necessary processes are carried out digitally. The whole evaluation process is also done online with the help of online cutting-edge AI technology thus reducing the cost of logistics.
